

# Package ‘aiRly’

July 22, 2025

**Type** Package

**Title** R Wrapper for 'Airly' API

**Version** 0.1.0

**Maintainer** Piotr Janus <piotr\_janus@icloud.com>

**Description** Get information about air quality using 'Airly' <<https://airly.eu/>> API through R.

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.1.0

**Imports** utils, httr, jsonlite, reshape2, tibble

**URL** <https://github.com/piotrekjanus/aiRly>

**BugReports** <https://github.com/piotrekjanus/aiRly/issues>

**Language** en-US

**Suggests** testthat, httpptest, covr

**NeedsCompilation** no

**Author** Piotr Janus [cre, aut]

**Repository** CRAN

**Date/Publication** 2020-03-19 14:00:02 UTC

## Contents

.base_url . . . . .	2
.get_apikey . . . . .	3
.send_request . . . . .	3
add_json_extension . . . . .	4
add_path . . . . .	4
assert . . . . .	5
assert_apikey . . . . .	5
assert_coordinates . . . . .	5

assert_ids . . . . .	6
build_current_df . . . . .	6
build_forecast_df . . . . .	7
build_history_df . . . . .	7
create_airly_api_response . . . . .	8
create_airly_location . . . . .	8
create_airly_measurement . . . . .	9
create_airly_meta . . . . .	9
create_request_url . . . . .	10
get_content . . . . .	10
get_indexes . . . . .	11
get_installation_by_id . . . . .	11
get_installation_measurements . . . . .	12
get_measurements_info . . . . .	12
get_nearest_installations . . . . .	13
get_nearest_measurements . . . . .	13
get_point_measurements . . . . .	14
is_airly_api_response . . . . .	15
is_airly_location . . . . .	15
is_airly_measurement . . . . .	16
parse_json . . . . .	16
print.airly_measurement . . . . .	17
remaining_requests . . . . .	17
replace_null . . . . .	18
set_apikey . . . . .	18
validate_airly_api_response . . . . .	19
validate_airly_location . . . . .	19
validate_airly_measurement . . . . .	20
validate_airly_meta . . . . .	20

**Index** **21**

---

<code>.base_url</code>	<i>Return base url of Airly API v2</i>
------------------------	--

---

**Description**

Return base url of Airly API v2

**Usage**

`.base_url()`

---

.get_apikey	<i>Get Airly apikey</i>
-------------	-------------------------

---

**Description**

Get apikey that was set by user

**Usage**

.get\_apikey()

**Value**

apikey value of set api key

---

.send_request	<i>Sends a request to the specified url and retrieves it's content.</i>
---------------	---

---

**Description**

Sends a request to the specified url and retrieves it's content.

**Usage**

.send\_request(request\_url, apikey, query = NULL)

**Arguments**

request_url	url to be used
apikey	airly apikey
query	Default value is NULL. Optional argument if you want to add query to request

**Value**

parsed content of the response object

---

add\_json\_extension      *Adds the json extension to the given url*

---

**Description**

Adds the json extension to the given url

**Usage**

```
add_json_extension(url)
```

**Arguments**

url                      base url to which the json extension should be added

**Value**

url with the json extension added

---

add\_path                      *Adds the given path to the given url*

---

**Description**

Adds the given path to the given url

**Usage**

```
add_path(url, path)
```

**Arguments**

url                      base url to which the path should be added

path                      path that should be added to the url

**Value**

url with the given path added

---

assert	<i>Asserts a given expression and throws an error if it returns FALSE</i>
--------	---

---

**Description**

Asserts a given expression and throws an error if it returns FALSE

**Usage**

```
assert(expression, error)
```

**Arguments**

expression	R expression to be evaluated
error	message to be displayed when the expression is not fulfilled

---

assert_apikey	<i>Checks whether apikey is correctly set</i>
---------------	---

---

**Description**

Checks whether apikey is correctly set

**Usage**

```
assert_apikey(key)
```

**Arguments**

key	airly apikey
-----	--------------

---

assert_coordinates	<i>Checks whether apikey is correctly set</i>
--------------------	---

---

**Description**

Checks whether apikey is correctly set

**Usage**

```
assert_coordinates(lat, lng)
```

**Arguments**

lat	latitude as decimal degree
lng	longitude as decimal degree

---

assert_ids	<i>Checks whether ids are correctly defined. If not throws an error</i>
------------	---

---

**Description**

Checks whether ids are correctly defined. If not throws an error

**Usage**

```
assert_ids(ids)
```

**Arguments**

ids	maximum number of ids to retrieve
-----	-----------------------------------

---

build_current_df	<i>Creates an object representing Airly measurement</i>
------------------	---

---

**Description**

Creates an object representing Airly measurement

**Usage**

```
build_current_df(item)
```

**Arguments**

item	list returned by Airly API
------	----------------------------

**Value**

object representing a airly\_measurement

---

build_forecast_df	<i>Creates object containing information about history data for given API response</i>
-------------------	--

---

**Description**

Creates object containing information about history data for given API response

**Usage**

```
build_forecast_df(item)
```

**Arguments**

item	list returned by Airly API
------	----------------------------

**Value**

tibble representing a airly\_measurement with time, measures and indexes fields

---

build_history_df	<i>Creates object containing information about history data for given API response</i>
------------------	--

---

**Description**

Creates object containing information about history data for given API response

**Usage**

```
build_history_df(item)
```

**Arguments**

item	list returned by Airly API
------	----------------------------

**Value**

tibble representing a airly\_measurement with time, measures and indexes fields

create\_airly\_api\_response

*Creates an object representing a response from the Airly API. Also every API call return information about current limits What is used to assign variables in pkg.env*

---

### **Description**

Creates an object representing a response from the Airly API. Also every API call return information about current limits What is used to assign variables in pkg.env

### **Usage**

```
create_airly_api_response(response)
```

### **Arguments**

response            response object

### **Value**

object representing a response from the Airly API

---

create\_airly\_location *Creates an object representing Airly location*

---

### **Description**

Creates an object representing Airly location

### **Usage**

```
create_airly_location(item)
```

### **Arguments**

item                list returned by Airly API

### **Value**

tibble representing an airly\_location

---

`create_airly_measurement`

*Creates an object representing Airly measurement*

---

**Description**

Creates an object representing Airly measurement

**Usage**

`create_airly_measurement(item)`

**Arguments**

`item`            list returned by Airly API

**Value**

object representing a `airly_measurement`

---

`create_airly_meta`

*Creates a data.frame representing Airly meta*

---

**Description**

Creates a `data.frame` representing Airly meta

**Usage**

`create_airly_meta(item)`

**Arguments**

`item`            list returned by Airly API

**Value**

`data.frame` representing an `airly_meta`

---

create_request_url	<i>Creates a request url based on the given base url and passed paths. The json extensions is added automatically.</i>
--------------------	--

---

**Description**

Creates a request url based on the given base url and passed paths. The json extensions is added automatically.

**Usage**

```
create_request_url(url, paths, add_json_ext = TRUE)
```

**Arguments**

url	base url of the request
paths	vector of paths that should be added to the url
add_json_ext	boolean indicating if include ".json" at the end of request

**Value**

request url with added paths and the json extension

---

get_content	<i>Retrieves the response content</i>
-------------	---------------------------------------

---

**Description**

Retrieves the response content

**Usage**

```
get_content(x)
```

**Arguments**

x	airly_api_response object to retrieve content from
---	--

**Value**

content of the given airly\_api\_response object

---

get_indexes	<i>Get Airly available indexes</i>
-------------	------------------------------------

---

**Description**

Endpoint returns a list of all the index types supported in the API along with lists of levels defined per each index type.

**Usage**

```
get_indexes()
```

**Value**

object of airly\_meta class

**Examples**

```
get_indexes()
```

---

get_installation_by_id	<i>Get Airly installation by id</i>
------------------------	-------------------------------------

---

**Description**

Endpoint returns single installation metadata, given by id

**Usage**

```
get_installation_by_id(id)
```

**Arguments**

id	integer
----	---------

**Value**

airly\_location item

**Examples**

```
get_installation_by_id(2137)
```

get\_installation\_measurements

*Get Airly measurements for any geographical location given installation id*

---

**Description**

Endpoint returns measurements for concrete installation given by installation Id

**Usage**

```
get_installation_measurements(id)
```

**Arguments**

id                    integer, installation identifier

**Value**

object of airly\_measurements class

**Examples**

```
get_installation_measurements(8077)
```

---

get\_measurements\_info *Get measures used in Airly*

---

**Description**

Endpoint returns list of all the measurement types supported in the API along with their names and units.

**Usage**

```
get_measurements_info()
```

**Value**

data.frame with measure names and units

**Examples**

```
get_measurements_info()
```

---

`get_nearest_installations`*Get Airly nearest installations to given point*

---

**Description**

Endpoint returns list of installations which are closest to a given point, sorted by distance to that point.

**Usage**

```
get_nearest_installations(lat, lng, max_distance = NULL, max_results = NULL)
```

**Arguments**

<code>lat</code>	latitude as decimal degree
<code>lng</code>	longitude as decimal degree
<code>max_distance</code>	default value 3.0. All the returned installations must be located within this limit from the given point (in km). Negative value means no limit
<code>max_results</code>	default value 1. Maximum number of installations to return. Negative value means no limit

**Value**

data.frame of `airly_location` items

**Examples**

```
get_nearest_installations(50.11670, 19.91429, max_distance = 20)
```

---

`get_nearest_measurements`*Get Airly nearest measurements to given point*

---

**Description**

Endpoint returns measurements for an installation closest to a given location

**Usage**

```
get_nearest_measurements(lat, lng, max_distance = NULL)
```

**Arguments**

lat	latitude as decimal degree
lng	longitude as decimal degree
max_distance	default value 3.0. All the returned installations must be located within this limit from the given point (in km). Negative value means no limit

**Value**

data.frame of airly\_measurements items

**Examples**

```
get_nearest_measurements(50.11670, 19.91429, max_distance = 10)
```

---

get\_point\_measurements

*Get Airly measurements for any geographical location*

---

**Description**

Endpoint returns measurements for any geographical location

**Usage**

```
get_point_measurements(lat, lng)
```

**Arguments**

lat	latitude as decimal degree
lng	longitude as decimal degree

**Value**

object of airly\_measurements class

**Examples**

```
get_point_measurements(50.11670, 19.91429)
```

---

*is\_airly\_api\_response* Checks whether the given object is of the class *airly\_api\_response*

---

**Description**

Checks whether the given object is of the class *airly\_api\_response*

**Usage**

`is_airly_api_response(x)`

**Arguments**

x object to test if it is of the class *airly\_api\_response*

**Value**

TRUE if the object is of the class *airly\_api\_response*

---

*is\_airly\_location* Checks whether the given object is of the class *airly\_location*

---

**Description**

Checks whether the given object is of the class *airly\_location*

**Usage**

`is_airly_location(x)`

**Arguments**

x object to test if it is of the class *airly\_location*

**Value**

TRUE if the object is of the class *airly\_location*

is\_airly\_measurement    *Checks whether the given object is of the class airly\_measurement*

---

**Description**

Checks whether the given object is of the class airly\_measurement

**Usage**

```
is_airly_measurement(x)
```

**Arguments**

x                    object to test if it is of the class airly\_measurement

**Value**

TRUE if the object is of the class airly\_measurement

---

parse\_json            *Parses a json response*

---

**Description**

Parses a json response

**Usage**

```
parse_json(response)
```

**Arguments**

response            response object to parse

**Value**

parsed content of the given response

---

```
print.airly_measurement
```

*Print for "airly\_measurement" type objects*

---

### **Description**

Print for "airly\_measurement" type objects

### **Usage**

```
## S3 method for class 'airly_measurement'  
print(x, ...)
```

### **Arguments**

x	"airly_measurement" type list
...	further arguments passed to or from other methods

---

```
remaining_requests
```

*Get information about remaining API requests*

---

### **Description**

Default rate limit per apikey is 100 API requests per day for all users. In order to get information, user has to make at least one request.

### **Usage**

```
remaining_requests()
```

### **Value**

list containing information about remaining requests and daily limit

### **Examples**

```
# Make any request before calling this function  
remaining_requests()
```

---

replace_null	<i>Replaces NULL with NA for nested lists. Useful when NULL value leads to error while object casting</i>
--------------	---

---

**Description**

Replaces NULL with NA for nested lists. Useful when NULL value leads to error while object casting

**Usage**

```
replace_null(x)
```

**Arguments**

x                    nested list

**Value**

same list with NULL replaced with NA

---

set_apikey	<i>Set Airly apikey</i>
------------	-------------------------

---

**Description**

On a free plan, API consumer is required to use our API only in non-commercial projects. More details are available in under <https://airly.eu/docs/tos-en.pdf>.

**Usage**

```
set_apikey(key)
```

**Arguments**

key                    string. Get your api key <https://developer.airly.eu/>

**Examples**

```
set_apikey("abctest")
```

---

validate\_airly\_api\_response

*Checks if the given response is not empty and that it did not return an error http code.*

---

### **Description**

Checks if the given response is not empty and that it did not return an error http code.

### **Usage**

```
validate_airly_api_response(airly_api_response)
```

### **Arguments**

airly\_api\_response  
airly\_api\_response object to be checked

---

validate\_airly\_location

*Checks whether the given object is correctly defined airly\_location class*

---

### **Description**

Checks whether the given object is correctly defined airly\_location class

### **Usage**

```
validate_airly_location(airly_location)
```

### **Arguments**

airly\_location tibble airly\_location

---

validate\_airly\_measurement

*Checks whether the given object is correctly defined  
airly\_measurement class*

---

**Description**

Checks whether the given object is correctly defined airy\_measurement class

**Usage**

```
validate_airly_measurement(airy_measurement)
```

**Arguments**

airy\_measurement  
object of the class airy\_measurement

---

validate\_airly\_meta *Checks whether the given object is correctly correctly defined*

---

**Description**

Checks whether the given object is correctly correctly defined

**Usage**

```
validate_airly_meta(airy_meta)
```

**Arguments**

airy\_meta      object of the class airy\_meta
