Package 'tracenma'

July 22, 2025

Type Package

Title Database for Developing Transitivity Methodology in Network
Meta-Analysis

Version 0.1.1

Date 2025-01-23

Maintainer Loukia Spineli <Spineli.Loukia@mh-hannover.de>

Description Functions to access the database of 217 data-frames with aggregate
study-level characteristics (that may act as effect modifiers) extracted
from published systematic reviews with network meta-analysis. The database shall
only be used for developing and appraising the methodology to assess
the transitivity assumption quantitatively.

tracenma-package	*tracenma: Database for Developing Transitivity Methodology in Network Meta-Analysis*

Description

A database with extracted study-level aggregate characteristics (that may act as effect modifiers) from 217 systematic reviews with network meta-analysis and a set of functions to facilitate access. The database is aimed at methodology development and appraisal to assess transitivity assumption quantitatively.

Details

R-package **tracenma** is built upon the R-package "nmadb: Network Meta-Analysis Database API" (archived) by using the provided database to define the set of connected networks and extract available study-level aggregate clinical and methodological characteristics (that may act as effect modifiers) from the corresponding systematic reviews. The database of **tracenma** currently includes a subset of the systematic reviews available in archived nmadb R package; the included systematic reviews were published between 2004 and 2015 and had available data characteristics for extraction.

tracenma comprises functions to access the catalogue with the available systematic reviews with network meta-analysis and datasets with the extracted characteristics.

tracenma should only be used for the purpose of developing and appraising methodology to assess the transitivity assumption quantitatively. **tracenma** should **not be used** in the context of an empirical-like study, for instance, to map the characteristics reported in specific healthcare fields, as the content and completeness of the extracted characteristics in **tracenma** strongly depend on the reporting quality and completeness of the considered systematic reviews, as well as the knowledge of the involved authors regarding the investigated research field. The latter also requires that the authors of systematic reviews are familiar with the notion of effect modification. Therefore, the extracted characteristics may not comprise a complete set of the necessary effect modifiers for the various investigated research fields.

Furthermore, most of the included systematic reviews reported the characteristics inconsistently across the studies. To achieve a consistent format, we proceeded to transformations using 1) the statistical methods that Wan et al. (2014) developed and evaluated for quantitative characteristics and 2) subjective judgments for qualitative characteristics. Therefore, the accuracy of the extracted data may have been compromised to some extent.

Type `citation("tracenma")` on how to cite **tracenma**.

To report possible bugs and errors, send an email to Loukia Spineli (<Spineli.Loukia@mh-hannove.de>).

The development version of **tracenma** is available on GitHub under the GPL-3.0 License.

get.dataset	*Get the selected dataset*

Description

Retrieving a dataset with study-level aggregate clinical and methodological characteristics (that may act as effect modifiers) extracted from the selected systematic review of the database.

Usage

```
get.dataset(pmid, show.index = FALSE, show.type = FALSE)
```

Arguments

pmid	A scalar with the PMID number of the systematic review found in the database.
show.index	Logical to indicate whether to return a data-frame with the full name of the abbreviated characteristics. The default is FALSE (do not report).
show.type	Logical to indicate whether to return a data-frame with the type (Demographic, Clinical, Methodological) and subtype (Age, Ethnicity, Intervention, Outcome, Participant, Risk of bias, Sex, Study design, Study setting, Withdrawals) of the characteristics. The default is FALSE (do not report).

Details

The selected dataset refers to a connected network for a specific outcome studied in the corresponding systematic review. Each characteristic occupies one column in the dataset. Characteristics pertaining to intervention features occupied one column for the experimental and another for the control treatment in the corresponding comparison.

Value

`get.dataset` returns the following:

Dataset
: A data-frame (tibble style) with rows referring to the studies and columns to the study-level aggregate characteristics as extracted from the report of the corresponding systematic review.

Characteristics_index
: A data-frame (tibble style) with the rows referring to the extracted characteristics (abbreviated name) and columns to the their full name (if show.index = TRUE), their type and subtype (if show.type = TRUE).

Author(s)

Loukia M. Spineli

Examples

```
get.dataset(pmid = 25626481)
```

---

get.dataset.index   *Get the index of specific dataset(s)*

Description

Retrieving the characteristics of one of more systematic reviews found in the database using their PMID number or year of publication.

Usage

```
get.dataset.index(pmid, year = NULL, show.title = FALSE, show.comment = FALSE)
```

Arguments

pmid
: A scalar or vector with the PMID number(s) of the systematic reviews found in the database.

year
: A scalar to define the year of publication. `get.dataset.index` will return all systematic reviews found in the database under this year.

show.title
: Logical to indicate whether to show the title of the selected systematic review(s). The default is FALSE (do not show).

show.comment
: Logical to indicate whether to show the comment referring to extraction notes about the selected systematic review(s). The default is FALSE (do not show).

Details

When `year` is specified, the argument `pmid` should be NULL. Then, `get.dataset.index` returns all systematic reviews found in the database under this year.

Value

`get.dataset.index` returns a vector (when `pmid` is scalar) or a data-frame (when `pmid` is a vector) with the following characteristics (column names):

`nmadb.ID`	The ID number as provided in the archived R package nmadb.
`PMID`	The PMID number.
`First.Author`	The name of the first author.
`Year`	The year of publication.
`Journal.Name`	The abbreviated name of the journal.
`Title`	The title of the systematic review.
`Outcome.Type`	The outcome type as suggested by Turner et al. (2012) and distinguished into objective, semi-objective and subjective.
`Intervention.Comparison.Type`	
	The treatment-comparator type as suggested by Turner et al. (2012) and distinguished into pharmacological versus placebo, pharmacological versus pharmacological, and non-pharmacological versus any.
`Includes.ToC.where`	
	Whether the extracted study-level aggregate characteristics were found in the main article, Appendix or both.
`Source.ToC`	The exact location in the systematic review where the extracted study-level aggregate characteristics were found, such as Table(s) in the main article, and/ or Appendix.
`Comment`	Notes related to the extraction for the selected systematic review(s).

Examples

```
# For one systematic review with PMID number 25626481.
get.dataset.index(pmid = 25626481)

# For two systematic reviews with PMID numbers 25626481 and 15147585,
# respectively.
get.dataset.index(pmid = c(25626481, 15147585))

# For systematic reviews published during 2010.
get.dataset.index(pmid = NULL, year = 2010)
```

---

index	*Dataset catalogue*

Description

A database with 217 systematic reviews with network meta-analysis (NMA) published from 2004 to April 14, 2015. The collected systematic reviews were retrieved from the archived R package nmadb and pertain to those with available data in that package.

Usage

```
data(index)
```

Format

A data-frame with 217 rows and 10 columns referring to the analysed systematic reviews with NMA and their characteristics, respectively.

Details

The characteristics of the systematic reviews comprise:

nmadb.ID	The ID number as provided in the archived R package nmadb.
PMID	The PMID number.
First.Author	The name of the first author.
Year	The year of publication.
Journal.Name	The abbreviated name of the journal.
Title	The title of the systematic review.
Outcome.Type	The outcome type as suggested by Turner et al. (2012) and distinguished into objective, se
Intervention.Comparison.Type	The treatment-comparator type as suggested by Turner et al. (2012) and distinguished into
Includes.ToC.where	Whether the extracted study-level aggregate characteristics were found in the main article,
Source.ToC	The exact location in the systematic review where the extracted study-level aggregate chara
Comment	Notes related to the extraction for the selected systematic review(s).

Except for **PMID**, **Includes.ToC.where**, **Source.ToC**, and **Comment**, all other characteristics were retrieved from the archived R package nmadb. The database was reduced further during extraction,

for instance, due to the limited reporting quality and data of the systematic review relating to the extraction process.
